Grüner Fachworkshop zum Thema Luftverkehr

Abstract / Kurzreferat (Seite 1 von 2)

Zweck – Basierend auf wissenschaftlichen Grundlagen liefert der Vortrag einen Überblick hinsichtlich einsetzbarer Energien und deren Klimawirkung abhängig von der Technik heutiger und zukünftiger Fluggeräte und deren Antriebssysteme. Dabei werden die Einsatzgebiete der Fluggeräte unterschieden in Urban Aviation, Kurz-, Mittel- und Langstrecke. Ein Vergleich mit anderen Verkehrsträgern wird angedeutet.

Methodik – Der Vortrag basiert auf den Forschungsergebnissen und Literaturstudien des Autors in den letzten mehr als 15 Jahren.

Ergebnisse – Urban Air Mobility ist für die Reichen, bietet keine Vorteile für die Umwelt und ändert nichts an den Staus in der Stadt. Kurzstrecken sollten mit der Bahn zurückgelegt werden. Für Mittelstrecken zwischen Megacities bieten Hochgeschwindigkeitszüge viele Vorteile. Ansonst könnten neu entworfene Propellerflugzeuge in intelligenter Auslegung, evtl. mit Wasserstoff, deutliche Vorteile bringen hinsichtlich Ökonomie und Ökologie – insbesondere wenn diese auslegungsbedingt tiefer und evtl. auch langsamer fliegen. Wir haben in der Luftfahrt weniger ein CO₂-Problem als mehr ein Wasserproblem (Aviation-Induced Cloudiness, AIC). Letzteres kann durch tieferes Fliegen vermieden werden. Jedoch: CO₂ setzt sich auf lange Zeiten durch. Auf der Langstrecke bieten sich Drop-In-Kraftstoffe aus erneuerbaren Energien (PtL-Kraftstoffe) an, weil LH₂-basierte Flugzeuge mit zunehmender Reichweite weniger effizient werden aufgrund der großen Kraftstofftanks. Drop-In-Kraftstoffe können für existierende Flugzeug eingesetzt werden und gehen das Klimaproblem daher Jahrzehnte früher an als LH₂-Lösungen. Aber: PtL-Kraftstoffe erfordern einen ca. 2,7-fach höheren Primärenergieeinsatz. Wichtig ist es daher, PtL und LH₂ parallel einzuführen. Batterie-elektrisches Fliegen geht nur auf Kurzstrecke, wo es nicht benötigt wird. Hybrid-elektrisches Fliegen hat keine technischen Vorteile für Passagierflugzeuge. Die höhere Effizienz der sogenannten Billigfluggesellschaften hinsichtlich Kraftstoffverbrauch und Umweltwirkung pro Passagierkilometer ist anzuerkennen. Wenn geringerer Verbrauch zu günstigeren Tickets führt, kann sich der freie Wettbewerb sogar positiv auf umweltfreundlicheres Fliegen auswirken. Da es durch den Rebound-Effekt aber zu einer Verbrauchssteigerung kommt, muss objektiv über die Umweltwirkung der Luftfahrt informiert und gegengesteuert werden. Graswurzelbewegung (Flugscham, Stay Grounded) sind ausdrücklich zu unterstützen. Die Luftfahrt wie sie heute (2019) existiert(e) kann mit regenerativen Energien nicht versorgt werden. (*Fortsetzung auf nächster Seite*)

Grüner Fachworkshop zum Thema Luftverkehr

Abstract / Kurzreferat (Seite 2 von 2)

Daher kann eine grundlegende Problemlösung nur gelingen, wenn weniger geflogen wird. Hier kann auf den Tatsachen aufgebaut werden, die durch COVID-19 geschaffen wurden. Beim Umbau der Luftverkehrswirtschaft müssen die Arbeitnehmer mitgenommen werden. Genauso wie es zu einer Verlagerung der Verkehrsströme auf umweltfreundlichere Verkehrsträger kommt, kann auch ein Wechsel der Arbeitsplätze beobachtet werden. Wir haben in Zukunft nicht weniger Aufgaben, sondern andere Aufgaben. Finanzielle Begünstigungen des Luftverkehrs gegenüber anderen Verkehrsträgern müssen abgebaut werden. In der Luftfahrtforschung sollte nur noch das gefördert werden, was vorab über eine Ökobilanz seine Sinnfälligkeit gezeigt hat. Darüber hinaus sollte der gesellschaftliche und ökonomische Nutzen sichtbar werden (Socio-Eco-Efficiency). Statt Milliarden Euros an Runden Tischen bei unklaren Kriterien ("alte Stinker") zu verschieben, brauchen wir einen öffentlichen Diskurs über schwergewichtige Entscheidungen im Luftverkehr. Nur ein solches transparentes Vorgehen wird dem Anspruch an unsere Demokratie gerecht. Dazu müssen Parameter der Luftfahrt und der Flugzeuge offen gelegt werden. So ein Vorgehen beginnt bei einer abgestimmten Definition zum Kraftstoffverbrauch von Flugzeugen und könnte z. B. auf ein Ökolabel für Flugzeuge ausgedehnt werden. Die Industrie sollte verpflichtet werden, entsprechende Basisangaben zu machen. Die didaktische Aufarbeitung kann durch die Wissenschaft erfolgen (notfalls auch ohne Hilfe durch die Industrie). Die Digitalisierung ist in der Luftfahrt genauso wichtig wie in anderen Bereichen, stellt aber in der Luftfahrt keine Besonderheit dar.

Soziale Bedeutung – Bei den Themen "Kabinenbelüftung und SARS-CoV-2" sowie "Zero Emission" konnte eine ethisch unhaltbare Art der Beeinflussung der Bevölkerung durch die Luftverkehrswirtschaft bei gleichzeitiger Unterstützung durch die Regierung beobachtet werden. Die Verbreitung von unwahren Behauptungen steht in Deutschland nicht unter Strafe, sollte aber nicht von der Regierung praktiziert werden und nicht durch finanzielle Zuwendungen belohnt werden. Hier bedarf es dringend einer Kehrtwende. Ein Beispiel dazu: Die Ausbildung durch die Hochschule von Ingenieur*innen im Flugzeugbau für die Industrie wird schwierig, wenn sich die Hochschullehre von den "alternativen Fakten" der Industrie unterscheidet.

118 kW
= 0.082 kW/kg

CO₂: CO₂=1000g/km (in Dubai)

CO₂=370g/km

CO₂ = 106 g/km

Lufttaxi: 200 \$ für 24 km (10 €/km) – Taxi Hamburg: 1,80 €/km

GLOBAL TRAVELER

Uber's \$200 helicopter taxi: Manhattan to JFK airport in 8 minutes flat

Durch Einsatz von Batterien und Elektromotor wird es nicht preiswerter!

Flugtaxi für Eliten

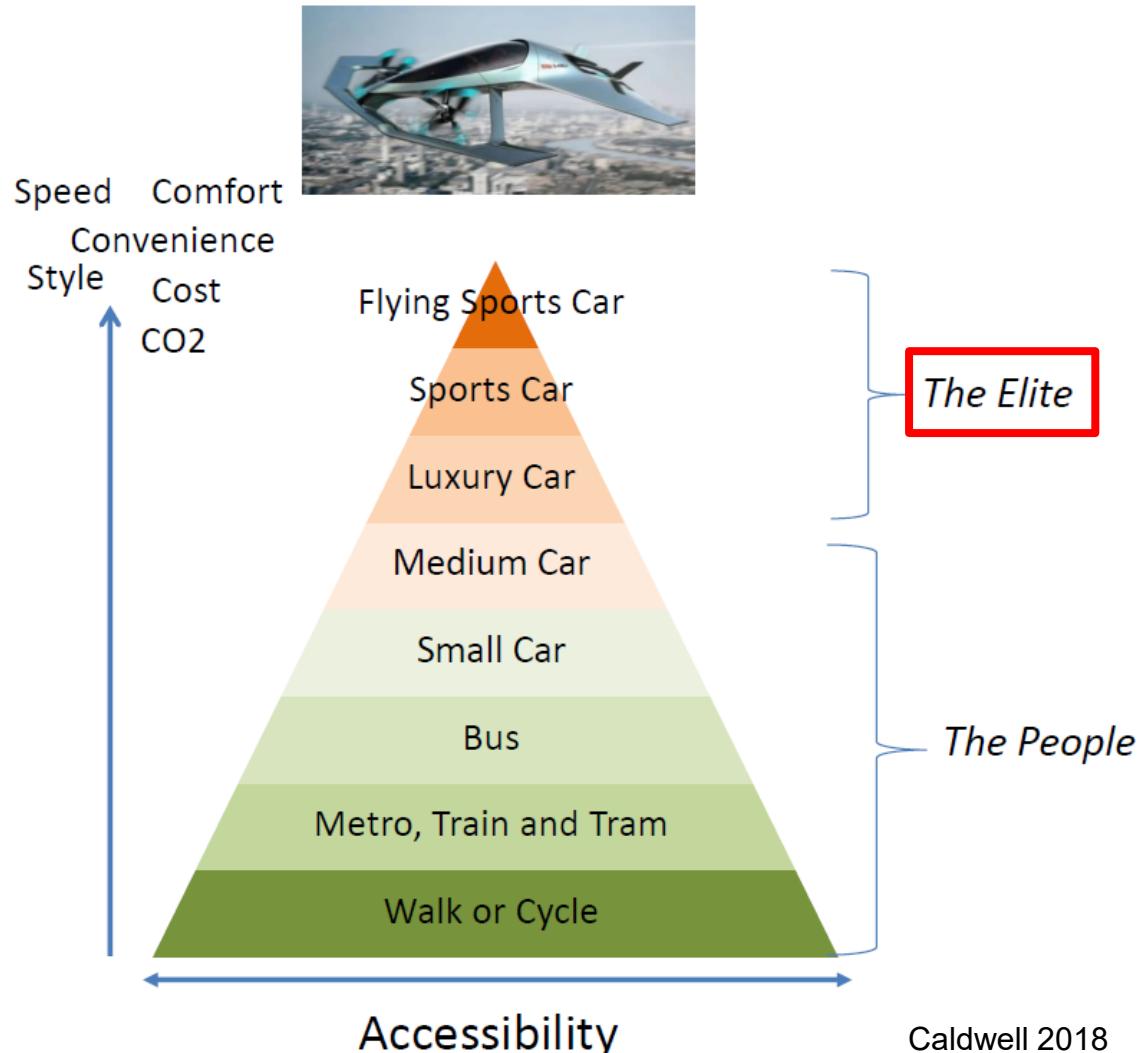

City Airbus, 4 Passagiere, max: **15 min.**

Keine technische Lösung!

Waiting for the City Airbus?

Keine Lösung der Verkehrsprobleme!

Kurzstrecke

Auf der Kurzstrecke nehmen wir die Bahn!

Elektromobilität, die am Netz betrieben wird gibt es bereits erfolgreich auf der Schiene!

Put the aircraft on tracks!

This replaces the Induced Drag, D_i , by Rolling Friction

- Aircraft: *Induced drag* is drag due to Lift = Weight. Train: *Rolling Friction* is also drag due to Weight.
- Aircraft: For minimum drag, *induced drag* is 50% of total drag.
- For the same weight, *rolling friction* of a train is 5% of the induced drag of an aircraft!
- This means: For the same weight, *drag of an aircraft is reduced by $\approx 47.5\%$ if put on rails!*

Mittelstrecke

Auf der Mittelstrecke zwischen Megacities nehmen wir die Bahn!

Verbindung von benachbarten Megacities – Beijing & Shanghai – Vergleich Flugzeug und Zug

Fly low and slow

Positive Umweltwirkung: Tiefer fliegen!

Changing the regular cruise altitude of an Airbus A320-200 of about 11500 m to an altitude of 6500 m at a constant Mach 0.78 would result in:

- a decrease of equivalent CO₂ mass of 78 % and
- an increase of fuel consumption of 5.6 %.

The increase of fuel consumption is mostly influenced by

- an increase of TSFC of 6.0 % and
- a decrease of the aerodynamic efficiency of 5.4 %.

Combining equivalent CO₂ mass and resource depletion (fuel consumption) into the environmental impact would result in a decrease of 70 % in environmental impact.

As the Mach number is kept constant, DOC are only effected by fuel consumption and increase by only 0.6%.

However, for the atmosphere this is an exchange of considerable less short term non-CO₂ warming potential versus a little more CO₂ long term warming potential. This exchange can be questioned, because it is not good for future generations.

Wasserstoff (LH₂)

Airbus: "Zero-Emission" Hybrid – Wasserstoff Passagierflugzeug

"At Airbus, we have the **ambition** to develop the world's **first zero-emission commercial aircraft by 2035.**"

Statement from 2020-09-21.

Beware! "Zero-emission" is never possible; not for aircraft, not for animals/humans (CO₂, CH₄).

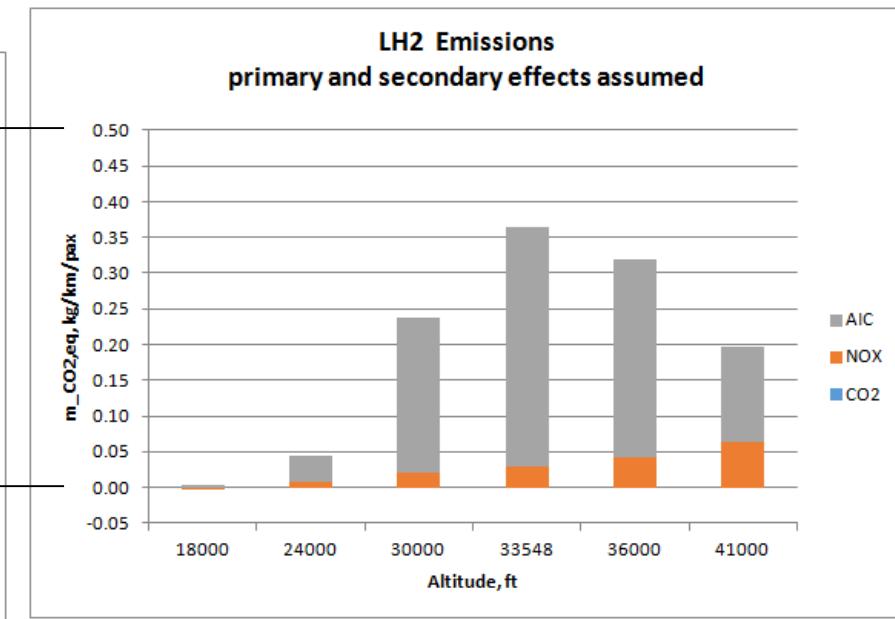

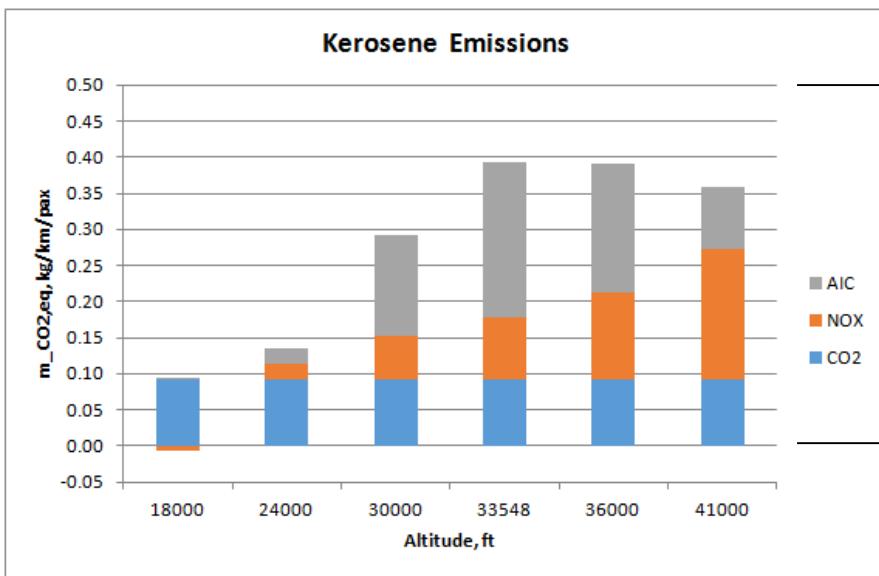

For details: SCHOLZ, Dieter, 2020. *Design of Hydrogen Passenger Aircraft – How much 'Zero-Emission' is Possible?*

Berechnung der Emission von Kerosin- und Wasserstoffflugzeugen – Ein Vergleich

Here **secondary effects** are applied on top of the primary effect for **contrails** due to larger ice crystals (factor 0.77) and for visible contrails (factor 0.77 assumed) leading all together to a **reduction factor** of $0.77^2 = 0.6$. The same factor is assumed for cirrus clouds. For **NOx** a factor of 0.35 is assumed due to lean combustion and low flame temperature. With that **equivalent CO₂** mass is now in the **order of that for kerosene propulsion**. See Excel table:
<https://doi.org/10.7910/DVN/DLJUUK>

LH₂ versus kerosene aircraft as function of altitude. LH₂ aircraft benefit at high or low altitudes compared to kerosene aircraft.

Altitude [ft]	rel. to kero
18000	1%
24000	32%
30000	81%
33548	93%
36000	82%
41000	55%

Elektrisches Fliegen ?

Berechnung der maximalen Reichweite beim batterie – elektrischen Fliegen

$$e_{bat} = \frac{E_{bat}}{m_{bat}}$$

$$L = W = m_{MTO} g$$

$$E = \frac{L}{D}$$

$$D = \frac{m_{MTO} g}{E}$$

$$P_D = DV = \frac{m_{MTO} g}{E} V = P_T = P_{bat} \eta_{prop} \eta_{elec}$$

$$V = \frac{R}{t}$$

$$P_{bat} = \frac{E_{bat}}{t} = m_{bat} e_{bat} \frac{V}{R}$$

$$m_{bat} e_{bat} \frac{V}{R} \eta_{elec} \eta_{prop} = \frac{m_{MTO} g}{E} V$$

$$R = \frac{m_{bat}}{m_{MTO}} \frac{1}{g} e_{bat} \eta_{elec} \eta_{prop} E$$

$$\eta_{elec} = 0.9; \quad \eta_{prop} = 0.8$$

 : realistic parameters

e_{bat} : specific energy

E_{bat} : energy in battery

E : glide ratio (aerodynamic efficiency)

L : lift

D : drag

W : weight

V : flight speed

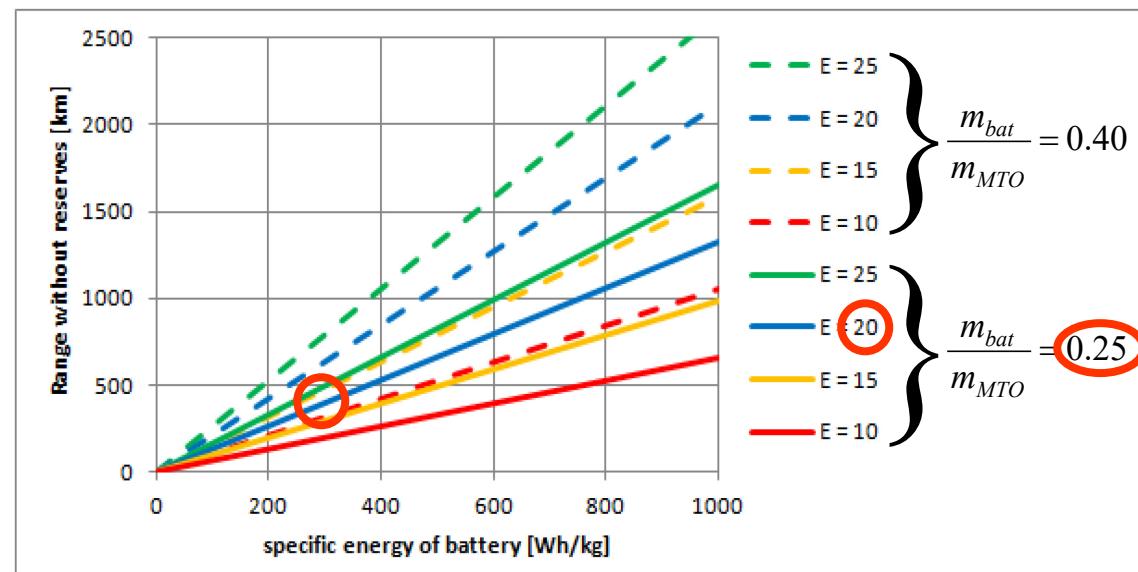

R : range

t : time

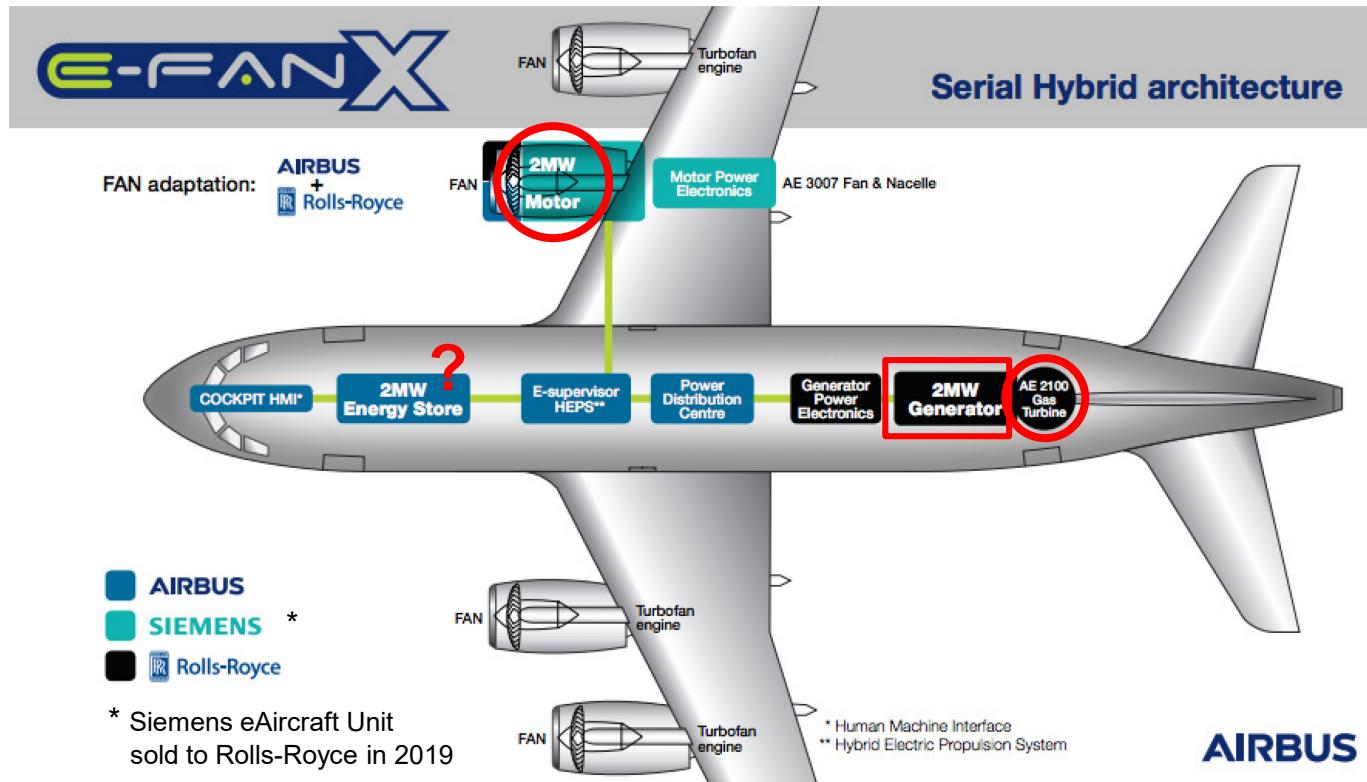

g : earth acceleration

P : power

η : efficiency (prop : propeller)

Airbus / Rolls-Royce: E-Fan X: hybrid – elektrisches Fliegen

- Electric engines have at best the same mass as an aviation gas turbine.
- The new propulsion system (gas turbine, generator, electric motor) has **at least 3 times the mass of the original propulsion system**, which could do with only the gas turbine.

Aeronautics: "The ecological transition requires a profound transformation of our industry"

Google translation
of French webpage.

Technical progress will not be enough to reduce greenhouse gas emissions from airplanes, essential against global warming, say more than 700 students from the aeronautics sector in a forum at the "World", who plead in favor of industrial conversions and a reduction in air traffic.

Digitalisierung

Digitalisierung

- Automatischer Flug: Autopilot & Flight Management System
- Schutzfunktionen: Flight Envelope Protection
- Autonomer Flug: VFR => IFR => Autonomous Flight Rules (AFR)
- Flugzeugsysteme / Avionik: Integrated Modular Avionics (IMA)
- Wartung: Health and Usage Monitoring Systems (HUMS),
Predictive Maintenance
- Airlines: Big Data (Flugzeug- und Passagierdaten),
Flight Performance Optimization, Multimodaler Verkehr
- Flugzeugentwurf: MDO, FEM, CFD, Virtual Reality (VR), ...
- Flugzeugbau: Industrie 4.0, Vernetzte Lieferketten,
- Automatisierung in der Fertigung, kollaborierender Roboter
- Weiterbildung: Digitales Lernen

Zusammenfassung

- Urban Air Mobility ist für die Reichen. Kein Umweltvorteil, Staus bleiben.
- Kurzstrecke auf die Bahn.
- Mittelstrecke zwischen Megacities auf die Bahn.
- Für die Mittelstrecke ansonst Propellerflugzeuge in intelligenter Auslegung, evtl. mit Wasserstoff.
- Langstrecke: Drop-In Kraftstoffe aus erneuerbaren Energien (SAF, E-Fuel), aber:
hoher Primärenergieverbrauch.
- Wir brauchen eine Verbrauchsangabe für Flugzeuge und eine Beachtung vorhandener Ökolabel.
- Beurteilung von Vorschlägen anhand von Ökobilanzen.
- Wir haben in der Luftfahrt weniger ein CO2-Problem als mehr ein Wasserproblem (AIC).
- Jedoch: CO2 setzt sich auf lange Zeiten durch.
- Tiefer fliegen bringt deutliche Vorteile.
- Batterie-elektrisches Fliegen geht nur auf Kurzstrecke, wo es nicht benötigt wird.
- Hybrid-elektrisches Fliegen hat keine technischen Vorteile für Passagierflugzeuge.
- Wasserstoff hat den gleichen Strahlungsantrieb, vermeidet aber die Ansammlung von CO2.
- Die Luftfahrt wie sie heute (2019) existiert(e) kann mit regenerativen Energien nicht versorgt werden:
Weniger fliegen.
- Die Digitalisierung ist in der Luftfahrt genauso wichtig wie in anderen Bereichen.

Backup / Ergänzungen

Many Possible Energy Paths for Aviation

1. fossile fuel	=> jet engine	no future solution
2. bio fuel (algae, ...)	=> jet engine	not sustainable
3. regenerative electricity	=> aerial contact line => electric engine	not for aviation => train!
4. regenerative electricity	=> battery => electric engine	electric: very short range
5. regenerative electricity	=> LH2 => jet engine	new infrastructure & planes but 2.7 times better efficiency than PtL
6. regenerative electricity	=> LH2 => fuel cell => electric engine	see 5.; heavy
7. regenerative electricity	=> PtL (drop in fuel) => jet engine	same infrastructure & planes
8. regenerative electricity	=> PtL => GT/Gen. => electric engine	hybrid electric , heavy
9. regenerative electricity	=> PtL => GT/Pump => hydraulic motor	hybrid hydraulic , heavy
PtL: Power to Liquid		GT: Gasturbine; Gen.: Generator

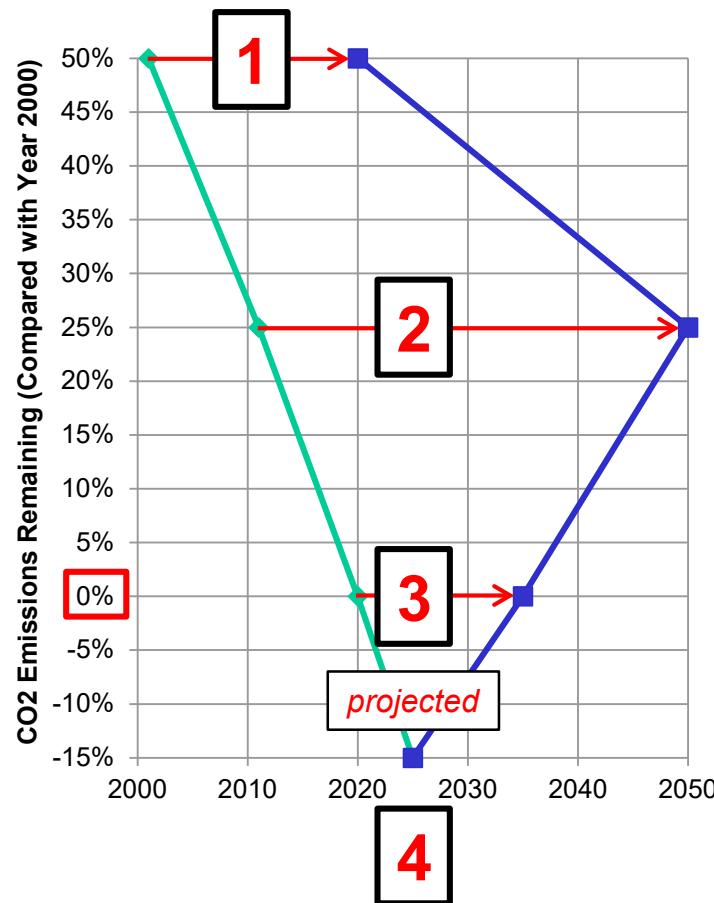

Additional conversions & major aircraft parts: **Solutions 6** (one more component) and **8/9** (two more comp.)

Validation of Transport Options – Are We Doing the Right Thing?

- Physics favor trains over aircraft (*low drag due to weight*) => less energy, less CO₂. Regenerative energy via aerial contact line efficiently fed into vehicle.
- PtL for jet/prop engines: Regenerative energy into aircraft NOW! But: Much primary energy needed!
- LH₂ for jet/prop engines: Less efficient aircraft (40% more consumption), new or modified aircraft needed. New infrastructure needed. Not as much primary energy needed for fuel production (2.7 times less than for PtL).
- Hybrid-electric propulsion has NO advantages for passenger aircraft.
- Unpredictable political environment for short range flights => high risk investment .
- Aircraft are the only means of transportation **over oceans long range**.
Ships are too slow and hence no regular service, bridges and tunnels are limited in length.
- Trains beat aircraft on **short range** (*less access time to station, less waiting time in station, ...*).
- Trains beat aircraft to connect **adjacent megacities over land** up to **medium range** with high volume.
A380 is too small and unfit, because designed for long range.
- Aircraft **over land**, if ...
 - **long range**,
 - **short range** and no train available due to **low volume traffic**
 - aircraft need less investment into infrastructure than (high speed) trains.
Construction costs for high speed trains: 5 M€/km to 70 M€/km (2005, Campos 2009)
 - alternative: **rail replacement bus service**
 - over **remote areas**, if no train is available (mountains, deserts, polar regions).

History of "Zero Emission" – The Logic of Political Goal Setting

- 1: ACARE: Vision 2020
- 2: ACARE: Flightpath 2050
- 3: Airbus, DLR*, ...: Zero Emission
- 4: Hypothetical, if political trend continues

* DLR, BDLI, 2020-11-14: Zero Emission Aviation.

Archived at: <https://perma.cc/M5VN-HG3Z>

Announced
Achieved

Goal setting is linked to asking for public money:

- If money came for goal #n, a goal #n+1 has to be proclaimed as the base for a new requests for more money.
- Goal #n+1 needs to surpass goal #n in terms of reduction percentage and in an ever shorter time frame for its achievement.
- Goal #n+1 is proclaimed before goal #n has been reached.

SCHOLZ, Dieter, 2020. Review of CO2 Reduction Promises and Visions for 2020 in Aviation. German Aerospace Congress 2020 (DLRK 2020), Online, 01.-03.09.2020. Available from: <https://doi.org/10.5281/zenodo.4066959>

EU-Study, May 2020: Aviation's Energy Demand – Too Much

The full global demand for LH, in aviation would require as much as 500 or 1,500 gigawatts of renewable energy capacity, depending on the scenario assumed, or about 20 or 60 percent of the total capacity of renewable energy available today.³⁸ Scaling up to this capacity would obviously raise significant planning challenges. That being said, if an energy-equivalent amount of synfuel from direct air capture were produced, it would require about three times the amount of renewable energy and one and a half times the amount of electrolysis. This is a significant drawback for synfuel, as the global energy system will already be challenged to scale up enough renewable energy to make the overall energy transition a success(as illustrated in the box on the next page.)

<https://doi.org/10.2843/471510>, Archived at: <https://perma.cc/BJJ6-5L74>

Footnote 38: Total generation capacity of renewable energy: 2351 GW (2018)

Globally, total renewable energy generation capacity reached 2,351 GW at the end of last year – about a third of total installed electricity capacity. Hydropower accounts for the largest share with an installed capacity of 1,172 GW – about half of the total. Wind and solar energy account for most of the remainder, with capacities of 564 GW and 480 GW, respectively. Other renewables included 121 GW of bioenergy, 13 GW of geothermal energy and 500 MW of marine energy (tide, wave and ocean energy).

<https://www.hydroreview.com/2019/04/03/irena-reports-renewable-energy-now-accounts-for-a-third-of-global-power-capacity>
Archived at: <https://perma.cc/YLY4-CG2R>

Aviation's energy demand today is too high: Minium needed all wind or solar energy available today!
First we need to reduce the amount of air travel.

Then we may have a chance to power aviation with renewable energy.

Desperately Needed: A Definition of the Aircraft's Fuel Consumption

Table 1: Summary of candidate metrics

Full Mission Metrics					
Single parameter metric	Block Fuel ----- Range				
Two-parameter metric	Block Fuel ----- Payload * Range	Block Fuel ----- Useful Load * R	Block Fuel ----- MTOW * Range	Block Fuel ----- Floor Area * R	Block Fuel ----- Av. Seats * R

	Block Fuel ----- Payload * R./Time	Block Fuel ----- Useful Load * R./Time	Block Fuel ----- MTOW * R./Time	Block Fuel ----- Floor Area * R./Time	Block Fuel ----- Av. Seats * R./Time
Instantaneous Performance Metrics					
Single parameter metric	$\frac{1}{\text{Specific Air Range}} = \frac{1}{\text{SAR}}$				
Two-parameter metric	$\frac{1}{\text{SAR} * \text{Payload}}$	$\frac{1}{\text{SAR} * \text{Useful Load}}$	$\frac{1}{\text{SAR} * \text{MTOW}}$	$\frac{1}{\text{SAR} * \text{Floor Area}}$	$\frac{1}{\text{SAR} * \text{Av. Seats}}$
Three-parameter metric	$\frac{1}{\text{SAR} * \text{Payload} * \text{Speed}}$	$\frac{1}{\text{SAR} * \text{Useful Load} * \text{Speed}}$	$\frac{1}{\text{SAR} * \text{MTOW} * \text{Speed}}$	$\frac{1}{\text{SAR} * \text{Floor Area} * \text{Speed}}$	$\frac{1}{\text{SAR} * \text{Av. Seats} * \text{Speed}}$

Note: R = Range

<http://partner.mit.edu/projects/metrics-aviation-co2-standard>

Selecting a Fuel Metric:

$$\frac{1}{(\text{SAR} \cdot n_{\text{seat}})}$$

$$\text{SAR} = \frac{V \cdot L/D}{SFC \cdot m \cdot g} ; \quad g = 9.81 \text{ m/s}^2$$

Specific Air Range; $1/\text{SAR}$ =fuel consumption can be **measured** in flight or **calculated** from basic aircraft parameters:

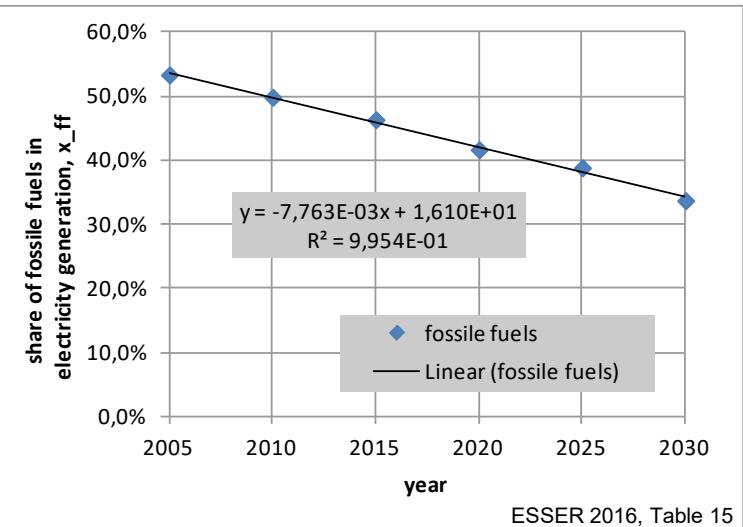

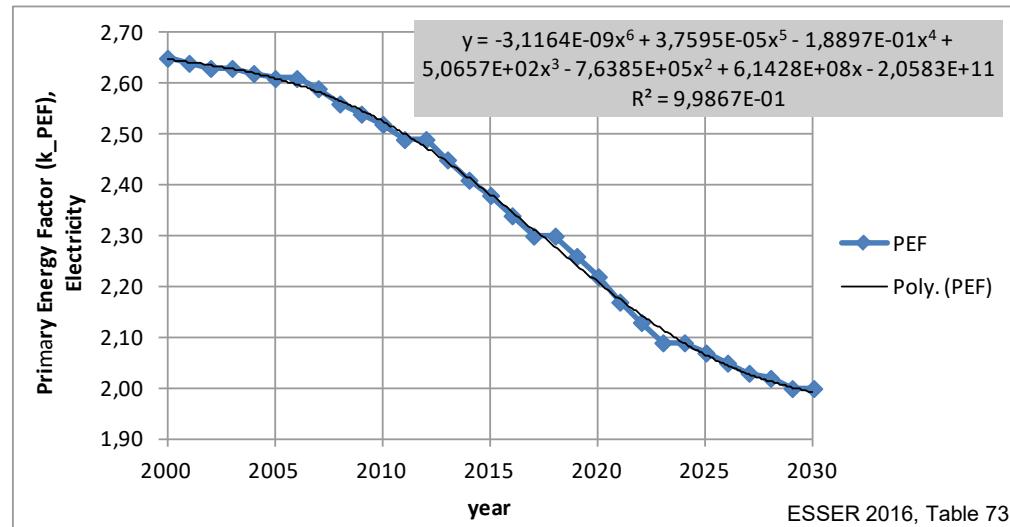

- aircraft mass, m
- aerodynamic efficiency, L/D
- specific fuel consumption, SFC
- aircraft speed, V

or **extracted from** published
Payload Range Diagrams

From Energy to Approximate Emission Comparison

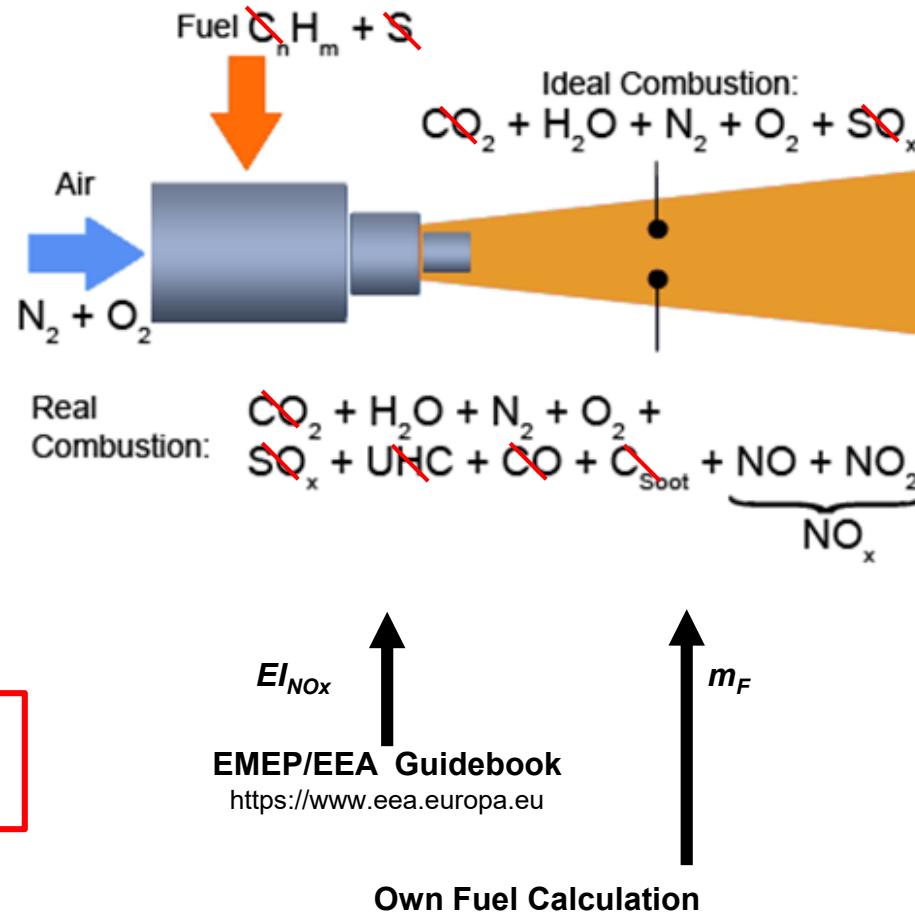

Type of Comparison	Kerosene	Electricity / Battery
Energy (wrong)	$E = m_F H_L$	$E = E_{bat} / \eta_{charge}$
Max. Exergy (not good)	$B_{max} = \eta_C H_L m_F$	$B_{max} = E$
Exergy (ok)	$B = \eta_{GT} H_L m_F$	$B = \eta_{EM} E$
Primary Energy (better)	$E_{prim} = 1.1 H_L m_F$	$E_{prim} = k_{PEF} E$
CO2 (without altitude effect)	$m_{CO2} = 3.15 \cdot 1.1 m_F$	$m_{CO2} = 3.15 \cdot x_{ff} E_{prim} / H_L$
Equivalent CO2 (good, simple)	$m_{CO2,eq} = m_{CO2} (k_{RFI} + 0.1)$	$m_{CO2,eq} = m_{CO2}$

$H_L = 43 \text{ MJ/kg}$ $\eta_{charge} = 0.9$
 Carnot Efficiency:
 $\eta_C = 1 - T/(h) / T_{TET} =$
 $= 1 - 216.65/1440 = 0.85$
 $\eta_{GT} = 0.35$ $\eta_{EM} = 0.9$
 Radiative Forcing Index:
 $k_{RFI} = 2.7$ (1.9 ... 4.7)

Kerosene and LH₂ Combustion

Altitude-Dependent Equivalent CO₂ Mass

$$m_{CO_2,eq} = \frac{EI_{CO_2} \cdot f_{NM}}{n_{seat}} \cdot 1 + \frac{EI_{NOx} \cdot f_{NM}}{n_{seat}} \cdot CF_{midpoint,NOx} + \frac{R_{NM}}{R_{NM} \cdot n_{seat}} \cdot CF_{midpoint,AIC}$$

Sustained Global Temperature Potential, SGTP (similar to GWP):

$$CF_{midpoint,NOx}(h) = \frac{SGTP_{O_3S,100}}{SGTP_{CO_2,100}} \cdot s_{O_3S}(h) + \frac{SGTP_{O_3L,100}}{SGTP_{CO_2,100}} \cdot s_{O_3L}(h) + \frac{SGTP_{CH_4,100}}{SGTP_{CO_2,100}} \cdot s_{CH_4}(h)$$

$$CF_{midpoint,cloudiness}(h) = \frac{SGTP_{contrails,100}}{SGTP_{CO_2,100}} \cdot s_{contrails}(h) + \frac{SGTP_{cirrus,100}}{SGTP_{CO_2,100}} \cdot s_{cirrus}(h)$$

Species	Emission Index, EI (kg/kg fuel)
CO ₂	3,15
H ₂ O	1,23
SO ₂	2,00 · 10 ⁻⁴
Soot	4,00 · 10 ⁻⁵

$$s_{O_3L}(h) = s_{CH_4}(h)$$

$$s_{contrails}(h) = s_{cirrus}(h) = s_{AIC}(h)$$

Species	SGTP _{i,100}
CO ₂ (K/kg CO ₂)	3,58 · 10 ⁻¹⁴
Short O ₃ (K/kg NO _x)	7,97 · 10 ⁻¹²
Long O ₃ (K/NO _x)	-9,14 · 10 ⁻¹³
CH ₄ (K/kg NO _x)	-3,90 · 10 ⁻¹²
Contrails (K/NM)	2,54 · 10 ⁻¹³
Contrails (K/km)	1,37 · 10 ⁻¹³
Cirrus (K/NM)	7,63 · 10 ⁻¹³
Cirrus (K/km)	4,12 · 10 ⁻¹³

EI	emission index
f _{NM}	fuel consumption per NM or km
R _{NM}	range in NM or km
CF	characterization factor
Cirrus/Contrails = 3.0	
water vapor not considered	
AIC	aviation-induced cloudiness

Altitude-Dependent Equivalent CO₂ Mass

$$m_{CO2,eq} = \frac{EI_{CO2} \cdot f_{NM}}{n_{seat}} \cdot 1 + \frac{EI_{NOx} \cdot f_{NM}}{n_{seat}} \cdot CF_{midpoint,NOx} + \frac{R_{NM}}{R_{NM} \cdot n_{seat}} \cdot CF_{midpoint,AIC}$$

↓
units only

$$\frac{kg\ CO2}{NM \cdot n_{seat}} =$$

$$\frac{kg\ CO2/kg\ fuel \cdot kg\ fuel/NM}{n_{seat}} \cdot 1 + \frac{kg\ NOx/kg\ fuel \cdot kg\ fuel/NM}{n_{seat}} \cdot \frac{kg\ CO2}{kg\ NOx} + \frac{NM}{NM \cdot n_{seat}} \cdot \frac{kg\ CO2}{NM}$$

Altitude-Dependent Equivalent CO₂ Mass

E.g.: $CF_{midpoint, cloudiness}(h) = \frac{SGTP_{contrails,100}}{SGTP_{CO_2,100}} \cdot s_{contrails}(h) + \frac{SGTP_{cirrus,100}}{SGTP_{CO_2,100}} \cdot s_{cirrus}(h)$

$$s_{contrails}(h) = s_{cirrus}(h) = s_{AIC}(h)$$

Forcing Factor $s = f(h)$

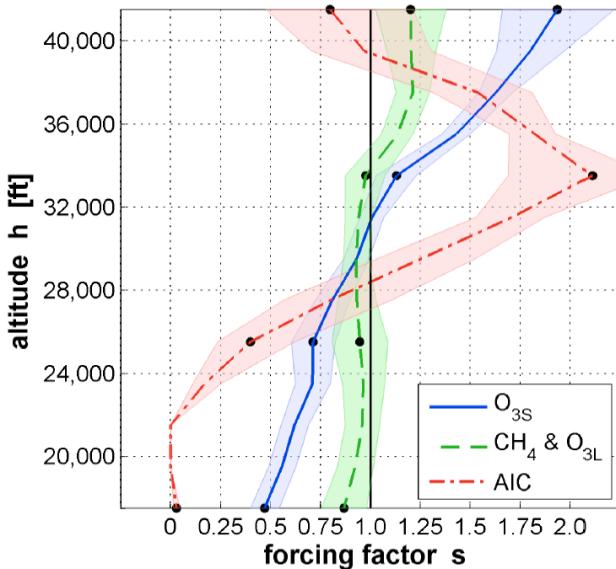

- The curves go along with the ICAO Standard Atmosphere (ISA) applicable for average latitudes. With a first approximation, the curves could be adapted to other latitudes by stretching and shrinking them proportionally to the altitude of the tropopause.
- The curves from SVENSSON 2004 (Fig. 1) show similar shapes. However, the importance of AIC is not yet as distinct.

SVENSSON, Fredrik, HASSELROT, Anders, MOLDANOVA, Jana, 2004. Reduced Environmental Impact by Lowered Cruise Altitude for Liquid Hydrogen-Fuelled Aircraft. In: *Aerospace Science and Technology*, Vol. 8 (2004), Nr. 4, pp. 307–320. Available from: <https://doi.org/10.1016/j.ast.2004.02.004>
