The Aircraft Mass Growth and Reduction Factor

Abstract

Purpose – This project work shows a [literature survey](#), clearly defines the mass growth factor, shows a mass growth iteration, and derives an [equation for a direct calculation of the factor](#) (without iteration). Definite values of the factor seem to be missing in literature. To change this, [mass growth factors are being calculated for](#) as many of the prominent passenger aircraft as to cover [90% of the passenger aircraft](#) flying today. The dependence of the mass growth factor on requirements and technology is examined and the relation to Direct Operating Costs (DOC) is pointed out.

Methodology – [Calculations start from first principles](#). Publically available data is used to calculate a list of mass growth factors for many passenger aircraft. Using equations and the resulting relationships, new knowledge and dependencies are gained.

Findings – The mass growth factor is larger for aircraft with larger operating empty mass ratio, smaller payload ratio, larger specific fuel consumption (SFC), and smaller glide ratio. [The mass growth factor increases much with increasing range](#). The factor depends on an increase in the fixed mass, so this is the same for the payload and empty mass. The mass growth factor [for subsonic passenger aircraft is on average 4.2](#), for narrow body aircraft 3.9 and for wide body aircraft (that tend to fly longer distance) 4.9. In contrast supersonic passenger aircraft show a factor of about 14.

Practical implications – The mass growth factor has been revisited in order to [fully embrace the concept of mass growth](#) and may lead to a better general understanding of aircraft design.

Social implications – A detailed [discussion of aircraft costs](#) as well as aircraft development requires detailed knowledge of the aircraft. By understanding the mass growth factor, consumers can have this discussion with industry at eye level.

Originality/value – The [derivation of the equation for the direct calculation of the mass growth factor](#) and the determination of the factor [using the method for 90% of current passenger aircraft](#) was not shown.

The image shows a project cover for HAW HAMBURG. It features the university logo at the top right. Below the logo, the word "Project" is written in a bold, sans-serif font. Underneath, the project title "The Mass Growth Factor – Snowball Effects in Aircraft Design" is displayed in a smaller, bold font. At the bottom, the author's name "Author: John Singh Cheema" is listed. Further down, the supervisor's name "Supervisor: Prof. Dr.-Ing. Dieter Scholz, MSME" and the submission date "Submitted: 31.03.2020" are provided. At the very bottom, the faculty and department names are listed in a smaller font: "Faculty of Engineering and Computer Science" and "Department of Automotive and Aeronautical Engineering".

- Summary

Background

- The aircraft mass growth factor is fundamental to aircraft preliminary design. Due to the fact that **mass during some aircraft design phases seems rather to increase** than to decrease compared to initial estimates, the factor is called **mass growth factor**.
- However, a mass reduction factor is mathematically the same. The **mass reduction factor** can lead to even substantial mass reduction and is as such the secret to efficient aircraft design. **For simplicity and tradition we may just talk about mass growth**.
- It is usually **defined as the ratio of an increase in the total mass (take-off mass) due to an arbitrary increase in local mass (empty mass)** determined after a full iteration in aircraft design to achieve the original performance requirements (payload and range).
- The aircraft design iteration sees after each loop another increment in the take-off mass, so that an initial (local) mass increase aggravates the situation like a snow ball transforming into an **avalanche**. Hence the pseudonym **snowball factor**.
- The concept of the mass growth factor is probably as old as aviation. It has been **discussed heavily from the 1950th to the 1970th** and has continued to be mentioned until today. Nevertheless, it seems not to be well enough understood today. Maybe its importance has declined due to **modern computing power** providing quite accurate mass estimates in each design phase, but **detaching the engineer from the feel for the numbers**.

Determination of mass fraction	
m _{MTO}	73000 kg
m _{PL}	18250 kg
m _{OE}	36500 kg
m _F	18250 kg
m _{PL} /m _{MTO}	0.250
m _{OE} /m _{MTO}	0.500
m _F /m _{MTO}	0.250

1. For the iteration method, the masses must be researched and thus the mass fractions determined

2. Enter the values in the blue fields

3. The iteration starts automatically and the mass growth factor is calculated

90% of aircraft considered globally with more than 19 seats by looking at 44 aircraft types.

ATR 72:
propeller aircraft,
short range

Cheema 2020

Wisdom Gained

- 1.) Larger aircraft do not necessarily have a higher mass growth factor.
- 2.) It does not matter how large the local mass growth is; the mass growth factor remains unaffected.*

$$m_{MTO} + \Delta m_G = m_{MPL} + m_{OE} + \Delta m_L + m_F$$

- 3.) It does not matter whether there is one kg more operating empty mass or one kg more payload on board. The mass growth factor for a growth in the operating empty mass is therefore the same factor as for a growth in the payload.
- 4.) Old long-range aircraft are more sensitive to local mass growth than new short-range aircraft.

- * This as long as the local mass growth is much smaller than the fixed mass. The position of the local mass growth does not matter, if the wing is not yet fixed and is positioned according to the new weight and balance situation.

Mass Growth Factor – Aircraft Categories

Table 4.1 Mass growth factor for different aircraft categories

Aircraft categories				
	Wide-Body	Narrow-Body	} Subsonic	Supersonic
k_{MG}	4.91	3.85	} 4.23	13.82

Mass Growth Factor – Obtained from Payload Fraction

After a longer derivation (Cheema 2020), we find a simple equation:

$$k_{MG} = \frac{m_{MTO}}{m_{MPL}} = \frac{1}{1 - \frac{m_F}{m_{MTO}} - \frac{m_{OE}}{m_{MTO}}}$$

Table 4.2 Mass growth factor for typical mass fractions

	Range type		
	Short-range	Medium-range	Long-range
m_{OE}/m_{MTO}	0.60	0.525	0.45
m_F/m_{MTO}	0.15	0.3	0.45
k_{MG}	4	5.7	10

Mass Growth Factor – Can Go to Infinity

$$k_{MG} = \frac{m_{MTO}}{m_{MPL}} = \frac{1}{1 - \frac{m_F}{m_{MTO}} - \frac{m_{OE}}{m_{MTO}}}$$

As soon as

$$\left(\frac{m_F}{m_{MTO}} + \frac{m_{OE}}{m_{MTO}} \right)$$

approaches 1.0 the mass growth factor, k_{MG} goes towards infinity!

This means the design task has no solution!

Mass Growth Factor – Payload Fraction from Statistics

$$k_{MG} = \frac{1}{\frac{m_{MPL}}{m_{MTO}}}$$

small A/C; short range

$$k_{MG} = 4 \dots 10$$

Scholz 2018

Mass Growth Factor – Obtained from Technology and Range

Scholz 2015

c	Specific fuel consumption
R	Range
B	Breguet factor
E	Glide ratio in cruise flight
V	Cruising speed

$$B = \frac{E \cdot V}{c \cdot g}$$

$$\frac{m_F}{m_{MTO}} = 1 - e^{-\frac{R}{B}}$$

$$\frac{m_{OE}}{m_{MTO}} = 0.5967 - 0.0000166(1/NM) \cdot R$$

Lehnert 2018

$$k_{MG} = \frac{1}{1 - (0.5967 - 0.0000166(1/NM) \cdot R) - \left(1 - e^{-\frac{R}{B}}\right)}$$

Mass Growth Factor – Linked to Direct Operating Costs (DOC)

Seat-Mile-Costs:

$$C_{s,m} = \frac{C_{a/c,t}}{R \cdot n_s} = \frac{C_{a/c,a}}{R \cdot n_s \cdot n_{t,a}}$$

$DOC = C_{DOC} = C_{a/c,a}$

← depends on cruise speed (given)
← range (given)

$$DOC \approx m_{MTO} = m_{OE} + m_F + m_{PL}$$

← payload (given, constant)
← fuel costs
← depreciation, maintenance costs

$$\frac{DOC}{n_s} \approx \frac{m_{MTO}}{m_{PL}} = \frac{1}{\frac{m_{PL}}{m_{MTO}}} = k_{MG}$$

$C_{a/c,a}$	Aircraft annual costs
$n_{t,a}$	Number of Flights per year
$C_{s,m}$	Seat-mile costs
$C_{a/c,t}$	Aircraft trip cost

Summary

- The mass growth (and reduction) factor is well known, but not well understood:
 - Derivation missing => added
 - Numerical values missing => added
- Average value for subsonic passenger aircraft: 4.2
range from 3.1 (ATR-72) via 6.2 (A380) and 6.5 (B747-400) to 15.6 (Concorde)
- The mass growth factor important for the design phase (snow ball effect) and also a good indicator to quickly understand the aircraft's economy.
- The mass growth factor can be estimated from basic parameters: range, R ; $E = L/D$; $c = \text{SFC}$; cruise speed, V :

$$k_{MG} = \frac{1}{\frac{m_{MPL}}{m_{MTO}}}$$

$$k_{MG} = \frac{1}{1 - (0.5967 - 0.0000166(1/\text{NM}) \cdot R) - \left(1 - e^{-\frac{R}{B}}\right)}$$

$$B = \frac{E \cdot V}{c \cdot g}$$
